Date: 2026-11-05
Auditor: Bina Labs
Verdict: NO EDGE

> CI [-0.3243, 0.0772] includes zero
> edge -0.1567, CI [-0.2940, -0.0184] excludes zero and is NEGATIVE - the system is significantly worse than a coin flip
> expectancy -0.1352 R/trade after costs 3 of 5 kill criteria triggered.

Method

Walk-forward evaluation on 31336 bars of XAUUSDm H1 from the broker's own feed. Parameters are chosen on a fixed grid using only data that existed before each test window; only out-of-sample numbers are reported. Every signal is paired with a coin-flipped control that keeps the entry bar, the stop distance and the target distance identical, so the only thing that changes is direction. Costs are the real ones: per-bar spread from the feed, slippage on every fill, and overnight swap converted from per-lot to per-unit.

1. Verdict in one line

Out-of-sample expectancy -0.1352 R per trade (95% CI [-0.3243, 0.0772]) over 314 trades. No edge by the criteria below.

2. Kill criteria, written down before the run

A system is declared no edge if any of these hold. They are fixed in advance and are not negotiable after seeing the result.

criterion	result
Out-of-sample expectancy 95% CI includes zero	TRIGGERED — CI [-0.3243, 0.0772] includes zero
Random-direction baseline not beaten significantly	TRIGGERED — edge -0.1567, CI [-0.2940, -0.0184] excludes zero and is NEGATIVE - the system is significantly worse than a coin flip
Edge survives on one symbol only	clear — median out-of-sample expectancy is positive on 2 of 7 other symbols (EURJPYm, USDJPYm)
Edge disappears under realistic spread + slippage	TRIGGERED — expectancy -0.1352 R/trade after costs
Fewer than 100 out-of-sample trades	clear — 314 out-of-sample trades

3. Walk-forward results

date	configs tried	OOS trades	expectancy R	95% CI	win rate	PF	cost/risk
2026-11-05	6	314	-0.1352	[-0.3243, 0.0772]	0.220	0.827	0.011

4. Random-direction baseline

The same signals, same entry bars, same stop distance, same target distance, direction mirrored. If the strategy does not beat this, the direction carries no information.

Computed on the full-history run with the a-priori parameter set {'range_bars': 10, 'min_pierce_atr': 0.25, 'buffer_atr': 0.5, 'min_rr': 1.0, 'atr_period': 14, 'cooldown': 6, 'max_hold': 96, 'slip_points': 2, 'comm': 0.0} (1376 trades), not on the walk-forward out-of-sample trades. The two numbers are deliberately separate: the walk-forward answers "does it generalise", this answers "is the direction real at all".

	expectancy R/trade
strategy	-0.1768
coin-flip control (direction mirrored, same stops/targets)	-0.0201
control sd	1.6034
edge	-0.1567
95% CI of the edge	[-0.2940, -0.0184]
bootstrap resamples where the edge is negative	98.6%

The direction is significantly worse than random. Flipping every signal would beat this system by 0.1567 R per trade. That is a finding, not a fix: inverting a dead strategy is a new hypothesis, and the registry (row 32) shows what happens when you try it - the inverse of a dead strategy is not a live one.

5. Cost stress

The same signals, same stops, same targets, run against a spread twice as wide and one extra pip of slippage on every fill. A large share of "edges" die here, and a customer who cannot reproduce this table has not been given a real cost model.

configuration	expectancy R/trade	change
as configured	-0.1768	—
spread x2, +1 pip slippage	-0.2079	-0.0311

6. Integrity audit

6.1 Data provenance

check	value
bars	31814
duplicate timestamps	0
non-monotonic timestamps	0
gaps larger than one bar	1852 (largest 74 bars)
bars from a different timeframe	478 (24x the requested bar size)
invalid OHLC	0
zero-range bars	0
median spread	0.200000
spread is constant	no

> 478 of the 31814 rows in this file are not H1 bars at all - they are bars spaced 24x apart. MT5 silently returns higher-timeframe bars for the period where the requested timeframe does not exist. This lab trims them before running anything. An EA written by hand usually does not, and a strategy backtested on those rows is being evaluated on a timeframe it does not use.

6.2 Look-ahead

For each signal we shift every bar strictly after the signal bar by a constant offset, keeping OHLC shape intact. If the decision changes - the signal disappears, or flips direction - the strategy read data that did not exist yet.

CLEAN. 1382 signals in the series; the 40 sampled were re-evaluated after shifting every bar up to 12 bars after their signal bar, with no change in existence or direction.

6.3 Unit of analysis

1376 trades came from 580 independent decisions (2.4 trades per decision). Counting trades as observations inflates the sample size and narrows the confidence interval artificially.

estimand	value	95% CI
per-trade, trades independent	-0.1768	[-0.2583, -0.1015]
per-trade, decisions resampled	-0.1768	[-0.2543, -0.0973]
mean per decision (other question)	-0.1895	not used

6.4 Swap units

MT5 quotes swap per lot. The cost model consumes it per unit. Getting this wrong does not raise an error; it silently multiplies the carry by the contract size.

	per lot	per unit	contract size
long	-630.6	-6.306000	100.0
short	0.0	0.000000	100.0

Carry as a fraction of price per night: 0.1597%

The per-unit figure is plausible for this instrument.

6.5 Simultaneous positions

The mirror held up to 4 position(s) at once across the 1376 closed trades it booked. Every EA shipped from this lab has an InpMaxOpen input (OB_FVG_EA.mq5: 1), and the simulator now supports the same cap. A strategy that fires repeatedly while a position is open is not trading the account the terminal would have run on - it is trading a portfolio.

Run again with InpMaxOpen = 1 and the identical signal set: 1131 trades instead of 1376 (245 could never have been placed), expectancy -0.1788 R per trade instead of -0.1768 R. The confidence interval on 1376 trades is not a confidence interval on the 1131 trades an account could actually hold.

Signals generated: 1382. Trades actually closed: 1376. Orders that never filled: 0. Trades rejected because a position was already open: 0. The last two numbers are the difference between a strategy and a strategy that can be executed.

7. Failures

Every parameter set we tried is recorded, including the ones that lost money. This is the part most vendors leave out, and it is the reason a negative verdict is believable.

1 of 1 recorded runs on this strategy/symbol/timeframe had negative out-of-sample expectancy.

date	configs tried	OOS trades	expectancy R	95% CI
2026-11-05	6	314	-0.1352	[-0.3243, 0.0772]

8. Reproducibility

```
python tools/audit_report.py --strategy sfp --symbol XAUUSDm --tf H1 --sample 40 --cluster-
gap 24 --out audits/sfp_xauusdm.md
python -m lab.cli integrity --symbol XAUUSDm --tf H1 --strategy sfp --sample 40 --cluster-
gap 24
python -m lab.cli eval --strategy sfp --symbol XAUUSDm --tf H1
```

Data: data/raw/XAUUSDm_H1.csv. Parameters used: {'range_bars': 10, 'min_pierce_atr': 0.25, 'buffer_atr': 0.5, 'min_rr': 1.0, 'atr_period': 14, 'cooldown': 6, 'max_hold': 96, 'slip_points': 2, 'comm': 0.0}.

9. What this means for you

The difference between this system and a coin flip is not statistically distinguishable. Whatever the vendor's screenshot shows, on your broker's own data, with your costs, the direction this system picks is not better than chance.

Two things follow. First, any profit you have seen from this system is explainable by luck, by the parameters chosen after the fact, or by a backtest that read the future. Second, the money is not in the signal; it is in the cost structure, and that is measurable.

This report is a measurement of a claim. It is not investment advice, it is not a recommendation to trade or stop trading, and it does not tell you what to do with your account.

Disclaimer
